A GLOBAL VOICE FOR LOCAL ACTORS OF CHANGE

Co-funded by the
Erasmus+ Programme
of the European Union

Here we tested the difficulties of disadvantaged students in the use of materials. Could you share with us the difficulties you had during this test?

Erasmus+ Programme
of the European Union

David Blunkett

Blunkett, who was born visually impaired and went to Sheffield School for the Blind at the age of 4, had very good reading and writing skills in Braille. For the first time in history, he entered the cabinet as a visually impaired minister in the UK government cabinet. He was the ministry of education and interior.

Dante Alighieri

Dante, the author of The Divine Comedy, had diseases of narcolepsy and muscle laxity.

Narcolepsy is the feeling of persistent need to sleep during the day. Muscle laxity is a result of this disease. Dante was also a patient of Epilepsy.

Stephen Hawking

He lost all muscle functions with the diagnosis of ALS (Amyotrophic Lateral Sclerosis) at the age of 21. He was recognized as the second physicist of the world after Einstein. The scientist, who has studies in the field of theoretical physics, made a significant impact on the properties of black holes, which he used from the theory of relativity and quantum physics. The fact that you can't use both of your arms isn't much of an obstacle to doing some things.

Salvador Dali

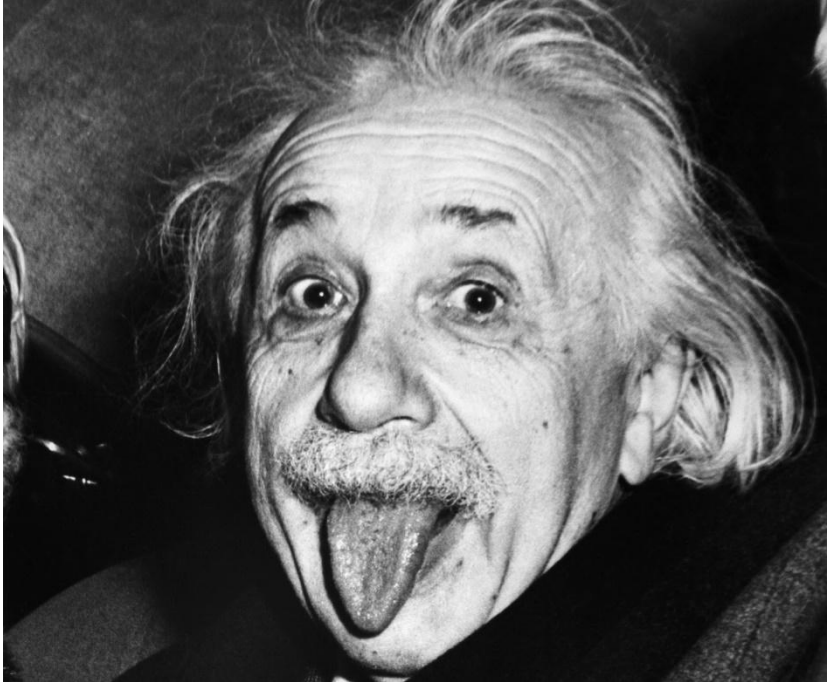

He had Parkinson's, one of the worst diseases for artist. He may have struggled for hours with this 30-piece jigsaw puzzle, let alone draw picture.

He had attention deficit and hyperactivity disorder.

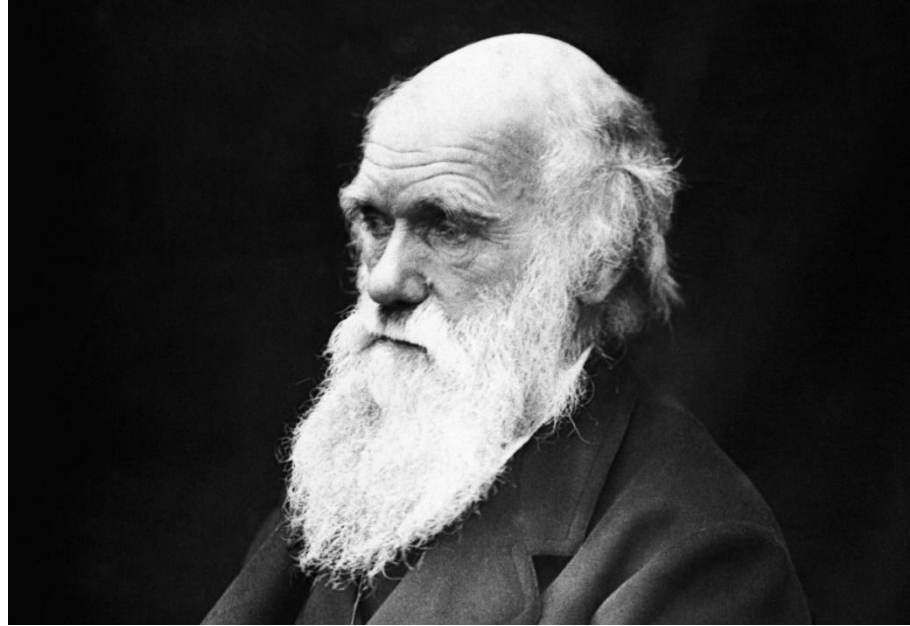

Leonardo di ser Piero da Vinci was an Italian artist who lived during the Renaissance. He was an important philosopher, astronomer, architect, engineer, inventor, mathematician, anatomist, musician, sculptor, botanist, geologist, cartographer, writer and painter of his time. His best-known works are The Vitruvian Man, The Mona Lisa, and The Last Supper.

Asperger's syndrome is an autism spectrum disorder that affects how people process and communicate information. It also causes problems with social interaction, including difficulty understanding other people's feelings and thoughts.

Albert Einstein

He is the foremost figure of modern physics. The most well-known work of the scientist diagnosed with autism is the theory of relativity. Autism, which manifests itself with limitations in social interaction, inability to establish eye interaction and language development, which usually occurs in infancy, is among the pervasive developmental disorders and is expressed as a state of mind.

Charles Darwin

Darwin, who did successful work on evolution, was a stutterer. He has also Chagas disease and soft wingless insects were circulating inside Darwin's body.

Success in inclusive classrooms depends on confident teachers who are competent in inclusive education, have positive attitudes and believe that all students can learn in the same classroom. One thing to consider while working with disadvantaged children is to value differences in the classroom. Today, factors such as the rapid change in technology, the tendency of countries towards economic and social unions require people from different origins and cultures, with or without disabilities, to live together and understand each other. The most important factor that prevents the creation of environments where diversity is respected and causes discrimination is the prejudices of the people.
